

UNIT 1: SIMPLIFY EXPRESSIONS

Page 1 of 1

~ Unit 1, Page 26 ~

Objectives: I can combine like terms to simplify variable expressions.

Combining Like Terms

In an expression, the **terms** are the elements separated by the plus or minus sign. A **coefficient** is the number being multiplied by a variable.

3 is the **coefficient**

3a
a is the **variable**

There are **three terms** below!

3a is a term.

b is a term.

-5 is a term.

3a + b + -5
3 terms!

Subtraction!
- change to "Add the opposite"

-5 is a **constant** b/c there is no variable beside it.

Like terms have the same variable(s).

2x + 3y + 4x - 5y

2x and 4x are like terms.

3y and -5y are like terms.

You can add like terms by adding their coefficients.

$$2x + 4x = 6x \quad \text{and}$$

$$3y + (-5y) = -2y$$

So you can simplify $2x + 3y + 4x - 5y = 6x - 2y$

$$2x + 3y + 4x + (-5y) = 6x - 2y$$

Practice

Problem 1. $2x + 3y + 1z$

- a) What number is the coefficient of x ? $\frac{2}{3}$
b) What number is the coefficient of y ? $\frac{3}{1}$
c) What number is the coefficient of z ? $\frac{1}{1}$

Typically, you do not write the coefficients 1 or -1.
 $1x = x$
 $-1x = -x$

$$5x + (-4y) + (-z)$$

Problem 2. $5x - 4y - z$ (hint: change the subtraction to plus the opposite)

- a) What number is the coefficient of x ? $\frac{5}{1}$
b) What number is the coefficient of y ? $\frac{-4}{1}$
c) What number is the coefficient of z ? $\frac{-1}{1}$

Problem 3. Add like terms.

a) $5x + 2x = 8x$

b) $6x - 2x = 4x$

d) $5x - x = 4x$

e) $-4x + 5x = x$

g) $-5x - 3x = -8x$

h) $-x - x = -2x$

j) $-3x - 4 + 2x + 6 = -x + 2$

l) $x + y - 2x + 3z = 2x + y + 3z$

4) $x + y + (-2x) + 3z = x + y - 2x + 3z$

c) $5x + x = 6x$

f) $4x - 5x = -x$

i) $-7x + 7x = 0$

$+$
 $-$
 zero pair

k) $x - 2 - 4x - 5 = -3x + (-7)$

m) $3x - y - 8x + 2y = -5x + y$

3x + (-4) + (-8x) + 2y
